

SM-RI-X

Turbine gas meters DN50 - 600
for custody transfer
in transmission and distribution

Applications

Gas measurement at low and high operating pressures

Brief information

Elster Instromet SM-RI-X turbine gas meters are robust meters for use under demanding conditions. Over decades they have proved themselves to be highly accurate and reliable devices for measuring the flow of many of gases.

The Elster Instromet SM-RI-X is unique, because of its good metrological performance and long-term stability. SM-RI-X are widely used for custody transfer of natural gas in transmission stations, distribution stations and as master reference meters.

Principle: The gas flow through the meter sets a turbine wheel in motion and the number of revolutions of the wheel is proportional to the passed volume.

The flow passes the patented X4X flow conditioner taking away any potential flow disturbances such as swirl or asymmetric flow.

When the gas passes through the flow conditioner, the flow velocity is increased and, consequently, the driving impulse on the turbine wheel is also increased. This results in a highly accurate measurement within the permissible error limits, even with low flow rates. The shaft of the wheel is mounted on robust ball bearings.

A gear reduces the revolutions of the turbine wheel. Via a magnetic coupling, a transmission shaft drives the 8-digit mechanical roller counter located in the index head. After the gas has passed the turbine wheel, it flows through a specific outlet channel, designed for optimum pressure recovery.

Conformity: Elster-Instromet SM-RI-X meters are manufactured in accordance with DIN EN ISO 9001:2000 (DIN EN ISO 14001). They are designed, produced and tested in accordance with the following guidelines, standards and references:

- EC Directive 97/23/EC concerning pressure equipment
- EC Directive 94/9/EC concerning explosion protection
- Applied German and European standards (et al. EN 12261)
- OIML provision R 32
- ISO 9951

All manufactured meters are tested on official, PTB and NMI approved test facilities. Test certificates in accordance with PED requirements are available for pressure tests and strength tests.

Material: The housings are made of GGG-40 (ductile iron) or steel. The meters meet the highest safety standards

Main features

- Meter types G 40 - 16000
- Flow range 8 - 25000 m³/h
- Diameters DN 50 - 600 (2" - 24")
- Pressure rates PN 10 - 100 and ANSI 150 - 600 (further pressure rates on request)
- Temperature range -10°C to +65°C (further temperature ranges on request)
- Compact installation, inlet pipe length $L \geq 2$ DN
- Length 3 DN
- Thermowell built into meter housing (optional)
- Integrated HF-pulser (optional)
- Absolute-ENCODER S1 (optional)
- Automatic lubrication system (optional)
- EC and different national approvals (e.g. PTB, NMI)
- Media: natural gas, petroleum gas, town gas, butane, air, nitrogen, further gases on request

SM-RI-X: Turbine gas meters for custody transfer

Multi-Index

A robust metal index, standard fitted with an internal LF Reed contact, which provides low frequency pulses.

Standard

6 pin Binder female 723 connection

Options

- 2nd LF Reed contact
- MF slot sensor
- Tamper protection reed contact
- Mechanical drive (Type 25H7 in accordance with EN 12261)
- Reverse flow barrier
- Binder male, Harting female connection box with PG fitting
- "Cryo" extension for operating with sub-zero temperature gas, and tropical version are combined with an aluminium silicate cartridge

Multi-Index

MF sensor

LF Reed contact

Absolute-Encoder S1

The Absolute-ENCODER S1 is a mechanical index, whereby the meter reading is opto-electronically scanned and transferred to the supplementary device via an electrical interface (e.g. EK260 volume corrector). Thus the Absolute-ENCODER index is an ideal combination of the advantages of mechanical and electronic indexes.

The procedure is certified by the German PTB.

The Absolute-ENCODER S1 does not require a power supply as the input is provided via the electrical interface of the supplementary device.

Available interface variations:
NAMUR, M-Bus and SCR

The Absolute-ENCODER S1 is also available as a clip-on index for a mechanical drive.

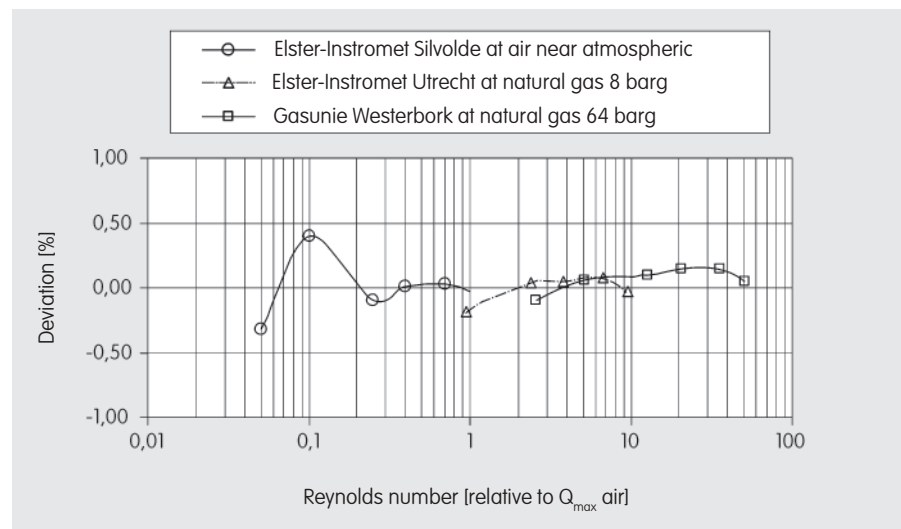

Accuracy, metrology

The SM-RI-X turbine gas meters in their metrological behaviour conform to the specifications of the European standard for turbine gas meters EN 12261. The measuring errors are smaller than half the fixed limits.

The standard specification of error limits are as follows:

$$\pm 0.5\% \text{ for } 0.2Q_{\max} \text{ to } Q_{\max}$$
$$\pm 1.0\% \text{ for } Q_{\min} \text{ to } 0.2Q_{\max}$$

Smaller limits on request

Typical characteristics of measurement errors

Each SM-RI-X meter is tested with atmospheric air to traceable calibrated references. Optionally, meters can be calibrated with air or natural gas on test facilities traceable to primary international standards.

Example:

For DN 250 and meter size G 1000, range 1:30, a minimum natural gas overpressure of $p_{\min} = 16$ bar is necessary.

atm = atmospheric pressure (air)

* Only metering range 1 : 10 possible

High pressure measuring range

Diameter	Meter size	Measuring range		
		1 : 20	1 : 30	1 : 50
		Minimum overpressure (p_{\min}) natural gas [bar]

Pressure loss

The average pressure loss of the SM-RI-X turbine meter using atmospheric natural gas with a density of 0.8 is measured at one (1) diameter upstream to one (1) diameter downstream of the meter on straight pipe of the same size as the meter.
